# NumPy and Pandas Quiz

What does the following code snippet do?

```
np.arange(1, 10, 2)
```

A

Return an array of integers from 1 to 10 (included) with step size 2.

B

Return an array of integers from 1 to 9 (included) with step size 2.

C

Return an array of integers from 1 to 9 (excluded) with step size 2.

D

Return an array of integers from 2 to 10 (included) with step size 1.

This file is meant for personal use by adugnaben@gmail.com only.

Sharing or publishing the contents in part or full is liable for legal action.

**NumPy** stands for **Numerical Python** - one of the fundamental packages for **mathematical, logical, and statistical operations** with Python

Provides powerful **n-dimensional array** object, called **ndarray**

Provides a large set of functions for creating, manipulating, and transforming ndarrays

Function	Syntax	Example	Description
<b>np.array()</b>	<code>np.array(object, dtype=None)</code>	<code>np.array([1, 2, 3])</code>	To create an array
<b>np.arange()</b>	<code>np.arange(start, stop, step)</code>	<code>np.arange(0, 10, 2)</code>	To create an array of evenly spaced values within a given interval

# NumPy and Pandas Quiz

What does the following code snippet do?

```
np.random.randint(10, 20, 1000)
```

A

Return an array of 1000 integers between 10 and 20 (excluded)

B

Return an array of 10 integers between 20 and 1000 (included)

C

Return an array of 10 integers between 20 and 1000 (excluded)

D

Return an array of 1000 integers between 10 and 20 (included)

This file is meant for personal use by adugnaben@gmail.com only.

# NumPy Functions

Function	Syntax	Example	Description
<b><code>np.random.rand()</code></b>	<code>np.random.rand(d0, d1, ..., dn)</code> <ul style="list-style-type: none"> <li><b><code>d0, d1, ..., dn:</code></b> The dimensions of the returned array.</li> </ul>	<code>np.random.rand(3, 2)</code>	To create an array of specified shape filled with random values from the uniform distribution
<b><code>np.random.randint()</code></b>	<code>np.random.randint(low, high, size)</code>	<code>np.random.randint(1, 10, size=(2, 3))</code>	To create an array of specified shape filled with random integers from low (inclusive) to high (exclusive)
<b><code>np.random.randn()</code></b>	<code>np.random.randn(d0, d1, ..., dn)</code> <ul style="list-style-type: none"> <li><b><code>d0, d1, ..., dn:</code></b> The dimensions of the returned array.</li> </ul>	<code>np.random.randn(2, 3)</code>	To create an array of specified shape filled with random values from the standard normal distribution

# NumPy and Pandas Quiz

Consider a dataframe `cust_data` having information on the following attributes of 200 customers (in the same order) - ID, Name, Age, Annual Income, Job Category  
Which of the following can be used to fetch the Age and Annual Income of the first 100 customers?

A

```
cust_data.iloc[:100, 2:3]
```

B

```
cust_data.iloc[:100, 2:4]
```

C

```
cust_data.loc[:100, 'Age':'Annual Income']
```

D

```
cust_data.loc[:100, 'Age':'Job Category']
```

# Pandas

**Pandas** is primarily used for **analysis and manipulation of tabular data**

Offers two major data structures - **Series & Dataframe**

One can think of a **pandas dataframe like an excel spreadsheet** - data stored in rows and columns.

Function	Syntax	Example	Description
<b>df.loc[]</b>	<code>df.loc[row_label_start:row_label_end, column_label_start:column_label_end]</code>	<code>df.loc[10:100, 'Age':'Annual Income']</code>	Access elements via label-based indexing (includes the end label)
<b>df.iloc[]</b>	<code>df.iloc[row_index_start:row_index_end, column_index_start:column_index_end]</code>	<code>df.iloc[10:20, 2:4]</code>	Access elements via integer-based indexing (excludes the end index)

*This file is meant for personal use by adugnaben@gmail.com only.*

# NumPy and Pandas Quiz

Which of the following can be used to drop the Job Category column and ensures modification is directly made to the dataframe?

A

```
cust_data.drop('Job Category', axis=0, inplace=True)
```

B

```
cust_data.drop('Job Category', axis=1, inplace=False)
```

C

```
cust_data.drop('Job Category', axis=0, inplace=False)
```

D

```
cust_data.drop('Job Category', axis=1, inplace=True)
```

# Pandas Functions

Function	Syntax	Example	Description
<code>df.drop()</code>	<code>df.drop(labels, axis, inplace)</code>	<code>df.drop('Job Category', axis=1, inplace=True)</code>	Drop specified labels from rows or columns

**`inplace=True`:** Modifies a dataframe directly, avoids creating a copy of the original dataframe

**`axis=0`:** Performs operations row-wise

**`axis=1`:** Performs operations column-wise

	Axis = 1 →			Sum:
Axis = 0 ↓	1	2	5	8
	4	3	7	14
	3	6	9	18
	Sum:	8	11	21

# NumPy and Pandas Quiz

Consider a dataframe `df` having the columns `Gender` and `Height`. Which of the following can be used to get the average height by different categories of gender?

A

```
df.groupby(['Height'])['Gender'].mean()
```

B

```
df.groupby(['Gender']).Height.mean()
```

C

```
df.groupby(['Gender'])['Height'].mean
```

# Pandas Functions

Function	Syntax	Example	Description
<code>df.groupby()</code>	<code>df.groupby(['column_name']) [aggregate_column].agg_func()</code>	<code>df.groupby(['Gender']) ['Height'].mean()</code>	To split, apply and combine the data structures to get aggregated values wrt attribute(s)

# NumPy and Pandas Quiz

Consider two dataframes df1 and df2 containing a common column Cust\_ID.  
Which of the following code snippets will merge these two dataframes?

A

```
pd.merge(df1, df2, on='Cust_ID', how='inner')
```

B

```
pd.merge(df1, on='Cust_ID', how='inner')
```

C

```
df1.merge(df2, on='Cust_ID', how='inner')
```

D

```
pd.merge(df1, df2, on='Cust_ID')
```

# Pandas - Merge and Join

**join** - works best when joining dataframes on their indices (though you can specify another column to join on)

**merge** - more versatile and allows to specify columns (besides the index) to join on

**how='inner'**

Retains only the rows that are common between the dataframes

**how='inner'**

natural join

**how='outer'**

Retains all the rows from both the dataframes

**how='outer'**

full outer join

**how='left'**

Retains all the rows from the first dataframe and only the matching ones from the second

**how='left'**

left outer join

**how='right'**

Retains all the rows from the second dataframe and only the matching ones from the first

**how='right'**

right outer join

# Pandas - Merge Example

## LEFT JOIN

Syntax: `merged = pd.merge(left, right, on = 'Customer id', how = 'left')`

Index	Customer_id	Product
0	1	Oven
1	2	Oven
2	3	Oven
3	4	Television
4	5	Television
5	6	Television

Left Table

Index	Customer_id	State
0	2	California
1	4	California
2	6	Texas
3	7	Las Vegas
4	8	Las Vegas

Right Table

Index	Customer_id	Product	State
0	1	Oven	NaN
1	2	Oven	California
2	3	Oven	NaN
3	4	Television	California
4	5	Television	NaN
5	6	Television	Texas

After left join on Customer\_id

## RIGHT JOIN

Syntax: `merged = pd.merge(left, right, on = 'Customer id', how = 'right')`

Index	Customer_id	Product
0	1	Oven
1	2	Oven
2	3	Oven
3	4	Television
4	5	Television
5	6	Television

Left Table

Index	Customer_id	State
0	2	California
1	4	California
2	6	Texas
3	7	Las Vegas
4	8	Las Vegas

Right Table

Index	Customer_id	Product	State
0	2	Oven	California
1	4	Television	California
2	6	Television	Texas
3	7	NaN	Las Vegas
4	8	NaN	Las Vegas

After right join on Customer\_id

# Pandas - Merge Example

## INNER JOIN

Syntax: `merged = pd.merge(left, right, on = 'Customer id')`

Index	Customer_id	Product
0	1	Oven
1	2	Oven
2	3	Oven
3	4	Television
4	5	Television
5	6	Television

Left Table

Index	Customer_id	State
0	2	California
1	4	California
2	6	Texas
3	7	Las Vegas
4	8	Las Vegas

Right Table

Index	Customer_id	Product	State
0	2	Oven	California
1	4	Television	California
2	6	Television	Texas

After inner join on Customer\_id

## OUTER JOIN

Syntax: `merged = pd.merge(left, right, on = 'Customer id', how = 'outer')`

Index	Customer_id	Product
0	1	Oven
1	2	Oven
2	3	Oven
3	4	Television
4	5	Television
5	6	Television

Left Table

Index	Customer_id	State
0	2	California
1	4	California
2	6	Texas
3	7	Las Vegas
4	8	Las Vegas

Right Table

Index	Customer_id	Product	State
0	1	Oven	NaN
1	2	Oven	California
2	3	Oven	NaN
3	4	Television	California
4	5	Television	NaN
5	6	Television	Texas
6	7	NaN	Las Vegas
7	8	NaN	Las Vegas

After outer join on Customer\_id

# NumPy and Pandas Quiz

Consider a file `Customer_Data.csv` that contains multiple attributes of 100 customers. Which of the following can be used to load the file into a pandas dataframe?

A

```
pd.read_csv(Customer_Data.csv)
```

B

```
pd.read_csv("Customer_Data.csv")
```

C

```
pd.read_csv('Customer_Data.csv')
```

D

```
pd.read_csv(Customer_Data)
```

# Loading Datasets in Pandas

**read\_csv** - pandas function used to load datasets in CSV format into a pandas dataframe

**Syntax:** `df = pd.read_csv("file_name.csv")`

Pandas has to be imported with alias pd - `import pandas as pd`

The file name has to be enclosed in quotation marks (single or double)

Above syntax works when the file (dataset) is in the same working directory as the Python notebook

When the file (dataset) and the Python notebook are not in the same working directory, the path to the file has to be specified

This file is meant for personal use by adugnaben@gmail.com only.

Sharing or publishing the contents in part or full is liable for legal action.
